The Care Gap: What Happens After Discharge?

Source: Article

Sub-theme: Patient understanding of follow-up appointments. To ensure the continuity of their care after hospital discharge patients must have a clear understanding of their follow-up appointments. Some patients expressed difficulties in comprehending the follow-up appointments they themselves were to arrange and those that had been arranged for them to attend after leaving the hospital. For example, one patient was told their paperwork was sent to

Frustration about too much information given upon discharge

a specific hospital and “if you don’t hear from me, I should wait before I ring them...” [Patient 1] their follow-up ‘...’there’s one I’m not ent about this ... I don’t know what that’s about what that’s about, I need to speak with someone is it for?” [Patient 3] When a caregiver appointments that she [patient] will need?” [Caregiver 1].

Difficulty in comprehend follow-up appointment

Sub-theme: Information overload. Patients reported frustration about the amount of information given to them at the time of discharge’ ... *the doctor came and ... said... you can go home ... he was just telling me a whole lot of information...*” [Patient 2] with little time to clarify information being presented to them “... *I did ask a few questions ... there’s too much information in too short a time.*” [Patient 2] Staff also acknowledged gaps in discharge information “... *I don’t think we bother to like really to check their understanding actually, just checking their understanding I think is quite important as well.*” [Clinician 3 (Doctor)], and in particular patient’s understanding of discharge medications “...*they’re not able to tell me what they [medications] are for, but they can quite often tell me what the medication looks like and that they should be taking it at this time of day...*” [Clinician 4 (Doctor)]. Patients advocated for a discharge liaison person who can collate and convey all relevant information about their care and discharge plan in a streamlined manner and answer questions “ ...*the information that needs to be more streamlined...the idea of having some medical liaison, someone comes in and they’re like okay this is start and then they get pieces of all of the information and all of the different departments and comes in and says this is where we’re—to describe those kinds of processes.*” [Patient 3]

Omonaiye, O., Ward-Stockham, K., Darzins, P., Kitt, C., Newnham, E., Taylor, N. F., & Considine, J. (2024). Hospital discharge processes: Insights from patients, caregivers, and staff in an Australian healthcare setting. PLOS ONE, 19(9), e0308042. <https://doi.org/10.1371/journal.pone.0308042>

出院回到家
反而更惨，
还不如住院，
“It was much more worse after coming home from the hospital—I should’ve just stayed there.”

Hospital didn’t follow up and handle patient’s symptoms properly

Follow up and new symptoms - nipple discharge

Hi,

I went last week in the breast clinic and I had an ultrasound. It was an awful experience as the sonographer was so rude and she performed the ultrasound in 5 minutes. I had to argue for her to scan my armpit too. Ok, she said that she didn't see any lumps . She said I have a dense breast tissue

I'm here today, having nipple discharge. It's coming by itself and was white yesterday and today it's clear

I have pain on my breast and nipple . It's happening on my left side

I tried to contact my GP. I sent email. I contacted the Brest clinic. Nobody seems to care too much

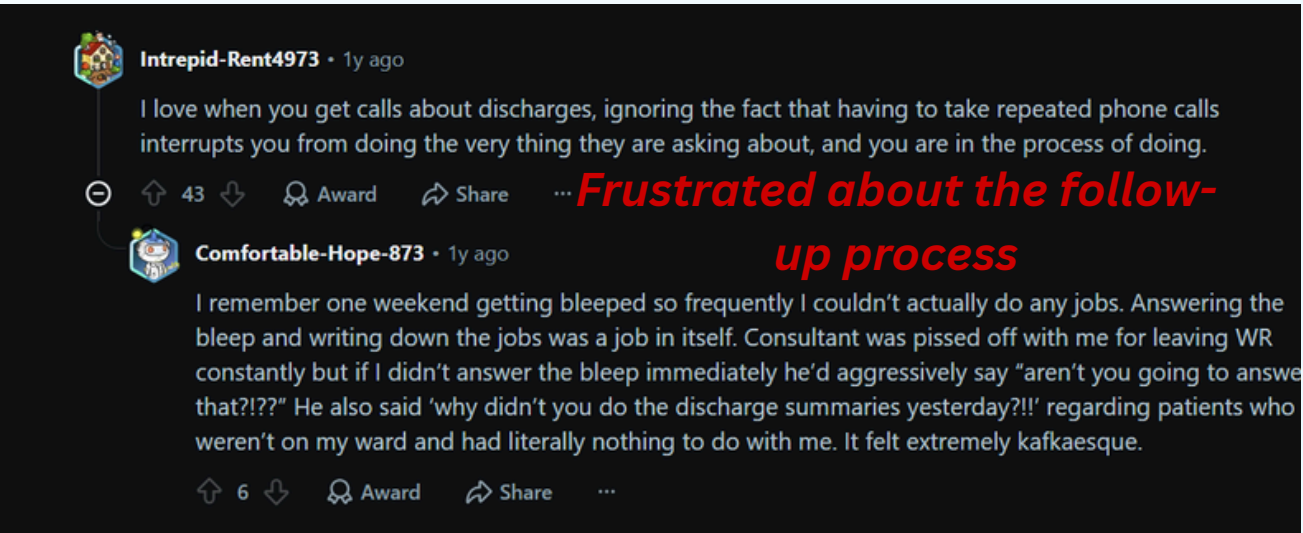

I'm panicking here. I wish I had money so I could pay a private specialist and private tests.

How does your hospital handle patient follow-up after discharge? Is the current system actually working?

Follow up relies on manual nurse call

I'm an Epidemiologist curious about this — from what I've read, 1 in 5 patients gets readmitted within 30 days and most hospitals rely on manual nurse calls. Is that what you're seeing on the ground? Would love to hear real experiences.

The Care Gap: What Happens After Discharge?

A critical look at the transition from hospital to home care

In the Hospital

24/7 Medical Care

Doctors & nurses monitor patients

Continuous care and supervision

Vital signs tracked

Real-time monitoring

Medication administered

Real-time monitoring

Safe, structured environment

At Home

Self-managed care

Patients left alone

No professional monitoring

Medication confusion

Missed doses, wrong timing

Symptoms go unnoticed

No early warning system

Fragmented, reactive care

What is the **ROOT CAUSE?**

Hospital Side

Fragmented information
(discharge notes, prescription)

Manual and unstructured follow-up processes

No real-time visibility after discharge

Patient Side

Cannot understand complex instructions and prescription

Forget or mismanage medication

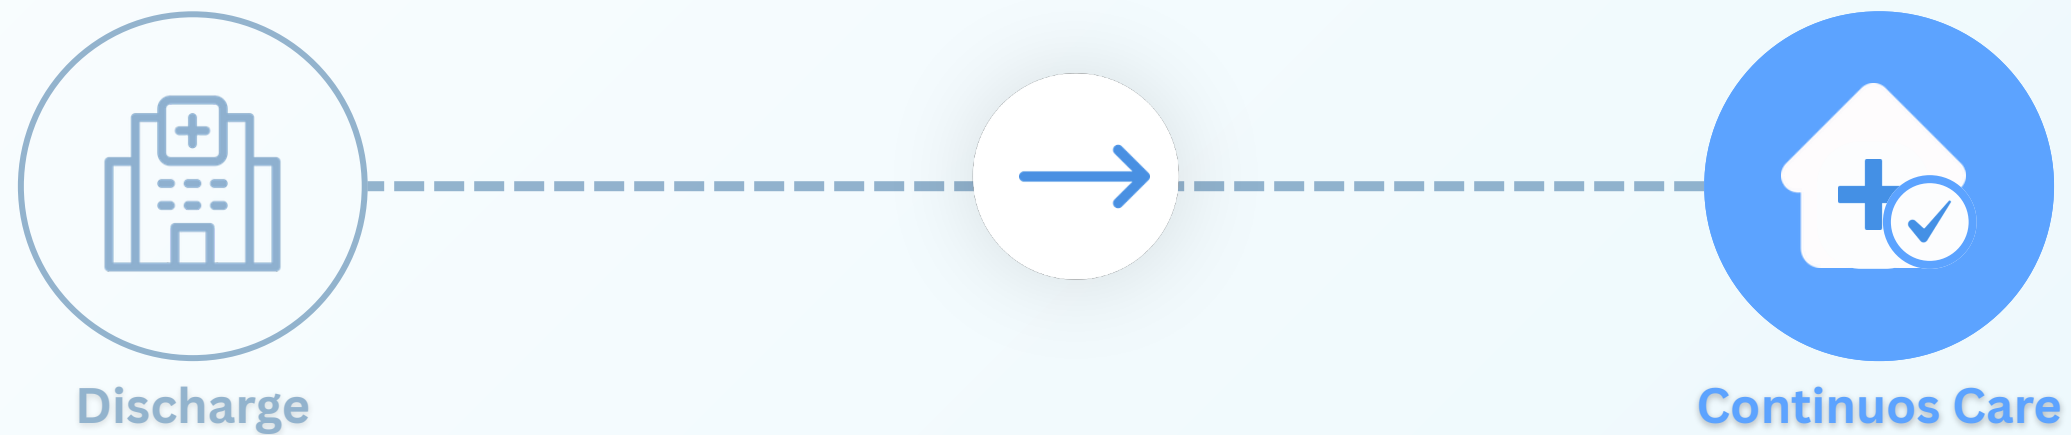

Symptoms and side effects not tracked

Post-discharge care is fragmented and reactive

Discharge is **not** the end of care.

It should be the start of a
continuous workflow.

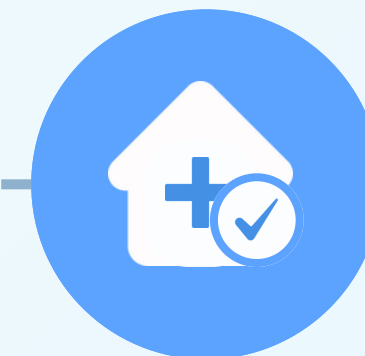

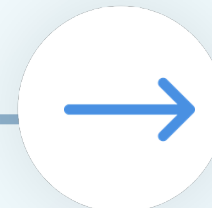

Medi-Sync+

Your Post-Discharge **Virtual AI Nurse**

Discharge

Continuos Care

Target Users: Who we Serve

Primary (Discharged patients)

Elderly

Athletes

**Cancer patients, chronic
disease patient etc.**

Secondary (Medical staffs)

Doctors

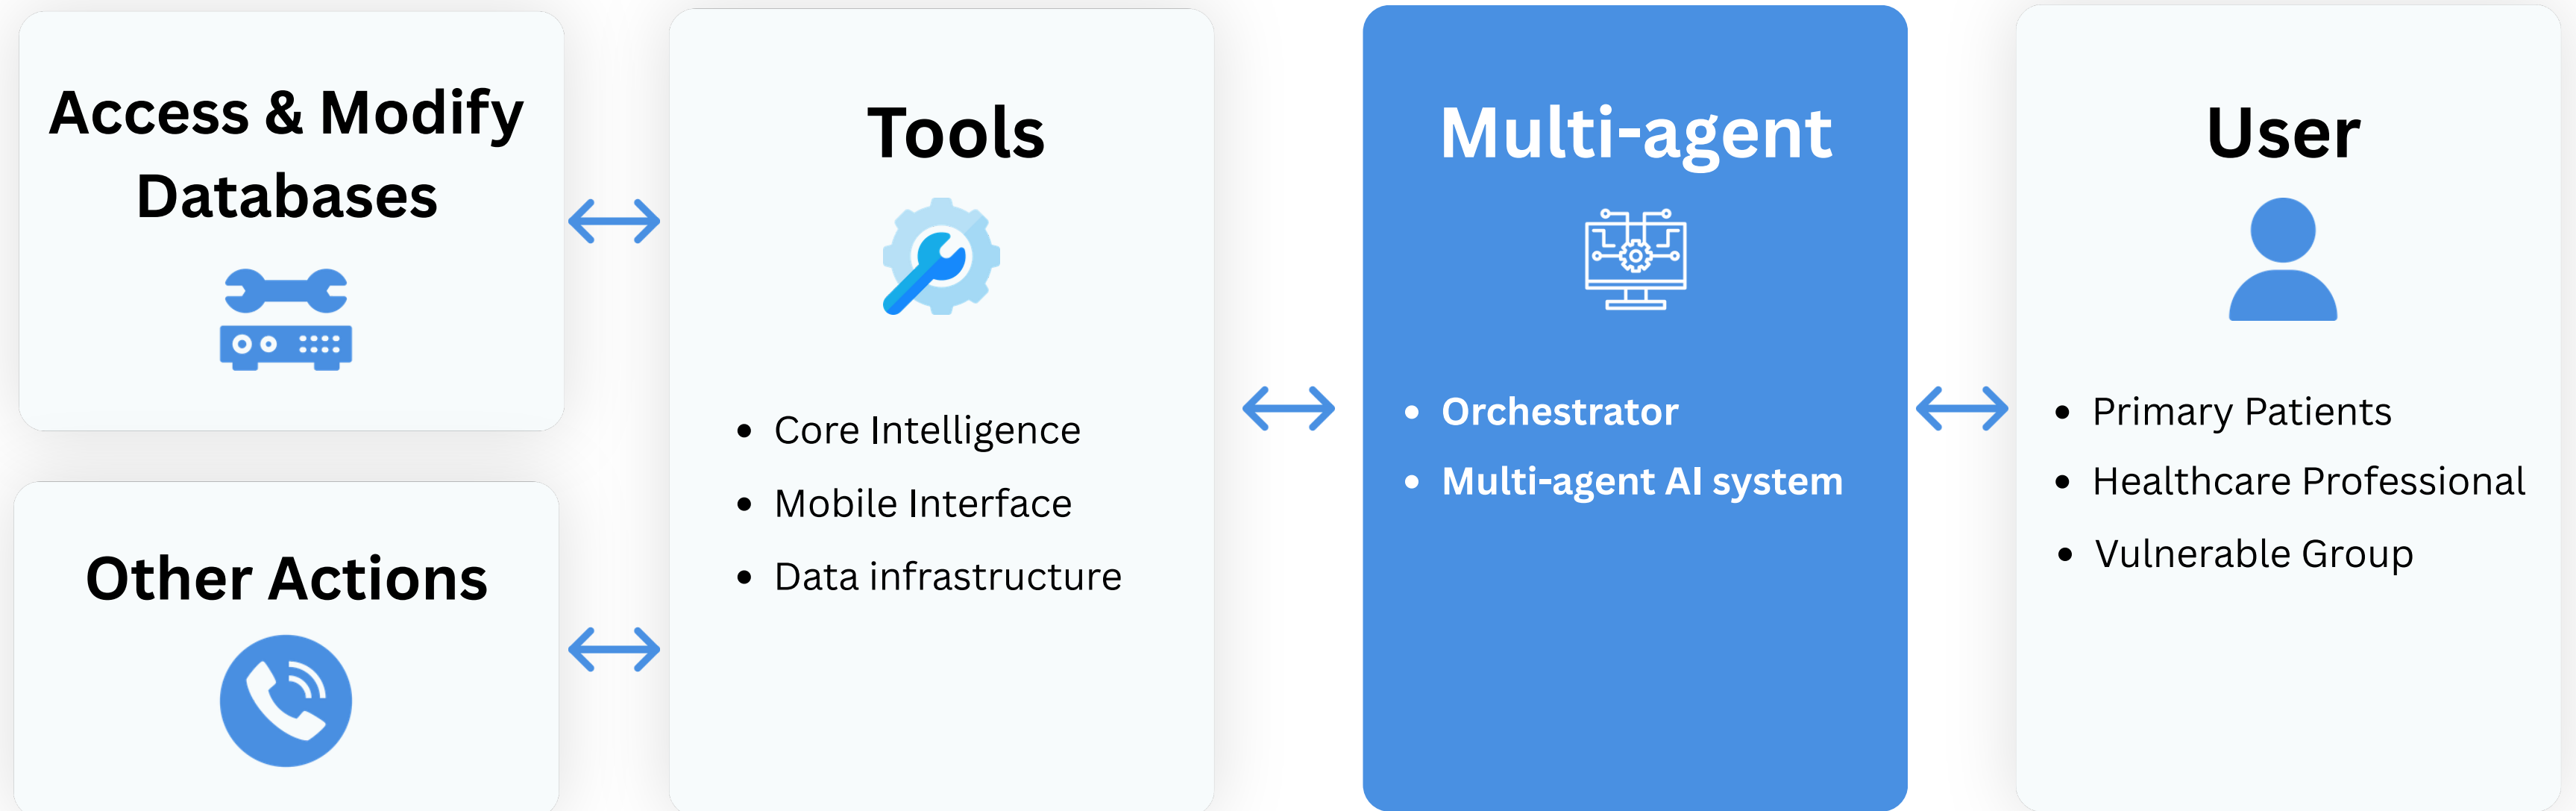

Nurses

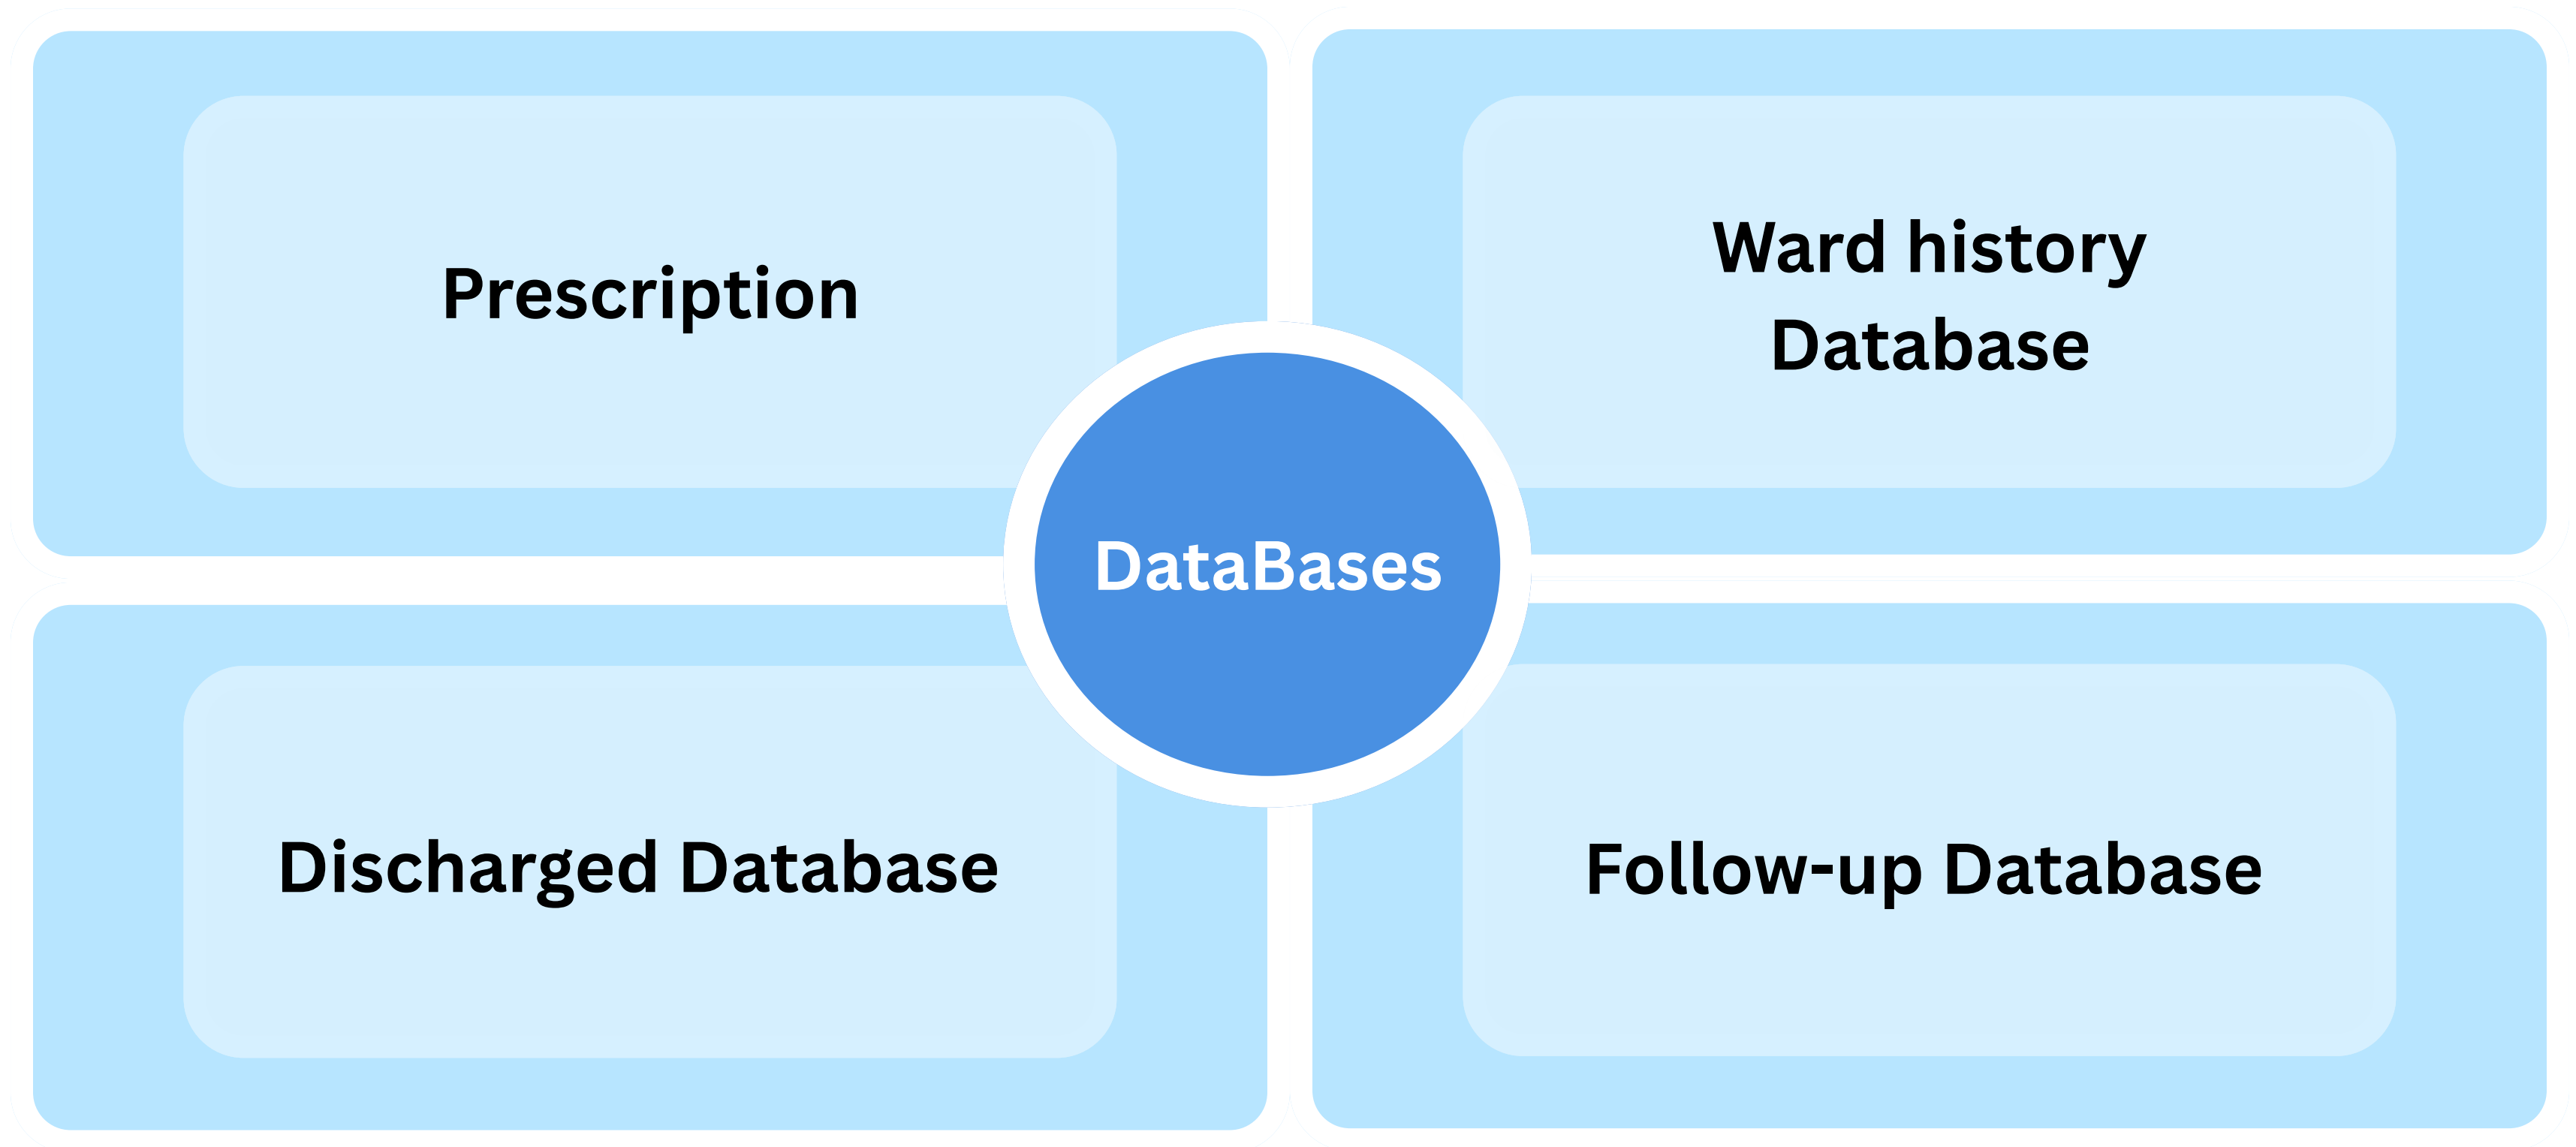

Pharmacist
